No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being print and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

ö
engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammancory agence; and in treatment of leukaemias. AAU25510-AAU331304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RENT1; nonsense-mediated RNA decay; NMRD; mutation; diagnosis; therapy; regulator of nonsense transcripts; Marfan Syndrome; aging; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This protein sequence is a fragment of the human RENTI protein which regulates nonsense-mediated RNA decay (MMRD). This fragment of RENTI shows homology to the yeast heat shock protein. Sislp and the Brassica napus RNA binding protein GRP10. The RENTI (regulator of nonsense transcripts) protein and other products can be used in the study, diagnosis and therapy of disorders involving NMRD such as Marfan Syndrome, accelerated aging or various cancers.
                                                                                                                                                                                                                          Gaps

Sequences AAY04742-Y05000 and AAY07201-Y07204 represent secreted

Mycobacterial DNA vectors containing reporter constructs identifying coding or promoter sequences involved in

infection-associated protein expression

Claim 32; Fig 15F; 309pp; French

Secreted protein; Mycobacterium; primer; PCR; amplification; probe; hybridisation; infection.

Mycobacterium sp.

WO9909186-A2

The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABL101840-ABL30511), expressed DNA sequences (ABL101840-ABL30511), expressed DNA (ABBS7737-ABB72072)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for
                                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel human secreted polypeptides. The polypeptides are useful for determining the presence of or predisposition to a disease associated determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, vaccination, gene therapy, nutritional supplement, stem cell proliferation, haematopoiesis, nerve tissue regeneration; immune suppression; immune stimulation, anti-inflammatory; leukaemia.

This sequence is obtained from wlk1 library. Clone wlk1.pk0028.el, derived from wheat seedlings, 1 hour after treatment with fungicide. It has 71% sequence identity to Hordeum vulgare sulphate permease (gi 1217967).

This sequence is used as a probe to isolate other plant sulphate assimilation proteins, for genetic and physical mapping of related genes and as markers of traits linked to the gene. This is useful for plant breeding and to construct chimeric genes, used to create transgenic plants with altered levels of sulphate permease. The sulphate permease peptides are useful for producing antibodies, that are used to screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid fragments encoding sulfate assimilation proteins in plants and seeds useful as probes for isolating cDNAs and genes encoding homologous proteins, in producing transgenic plants -

Coryneform bacterium; an organic acid synthesis.

```
The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, corpneform bacterium, corpneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, Coryneform bacterium, corpneform bacterium of an expension particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Thermus thermophilus DNA repair enzyme TRCF protein SEQ ID NO:8.

WPI; 1994-353749/44.

N-PSDB; AAQ73703

Gene for sucrose phosphate synthetic enzyme of rice - useful for increasing sugar and starch yield of plants

Claim 1; Page 5; 18pp; Japanese.

AAQ73703 encodes AAR60796 rice sucrose phosphate synthetic enzyme, this gene may be cloned into other edible plants to improve their synthesis of sucrose and starch.

Nucleic acids encoding 38 human secreted polypeptides, useful for preventing, diagnosing and/or treating e.g. cancers, Parkinson's disease and diabetic retinopathy -

Disclosure; Page 47; 488pp; English.

ANULGAI-PAUDIGOUS represent human secreted protein amino acid, and related amino acid sequences of the invention. The human secreted protein sequences are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnoshing a pathological condition. The antibodies to human susceptibility to a pathological condition. The antibodies to human secreted proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunosesays e.g. radicolmmunosesays or enzyme linked immunosorbent assays (ZLISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid architis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiorascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. correal infections caused by bacteria, viruses and also be used to ald wound healing and epithelial cell proliferation, to repend also be used transplantation, for supporting cell culture of primary tissues, to respend the same and in chemotraxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities.

"The allele-specific synthetic lethality of prlA-prlG double mutants predicts interactive domains of SecY and SecE."; EMBO J. 14:884-893(1995).

-!- FUNCTION: ESSENTIAL FOR PROTEIN EXPORT.
-!- SUBUNIT: PART OF THE PROKARYOTIC PROTEIN TRANSLOCATION APPARATUS WHICH COMPRISE SECA, SECB, SECB, SECF, SECG AND SECY. THE TRANSLOCATION CHANNEL SEEMS TO BE COMPSOBD OF A SECY THE FOUR COPISS OF A SECYAGE COMPLEX.
-!- SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane.
-!- SIMILARITY: Belongs to the secE/SEC61-gamma family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

"A mew class of plastidic phosphate translocators: a putative link

between primary and secondary metabolism by the

phosphoenolpyruvate/phosphate antiporter.";

plant Cell 9:453-46211997).

-I-PUNCTION: MEDIATES THE EXPORT OF FIXED CARBONS FROM THE

CHICROPLASTS INTO THE CYTOSOL IN THE FORM OF TRIOSE PHOSPHATES.

-I-SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. LOCATED IN

ZONES OF CONTACT BETWEEN THE INNER AND OUTER MEMBRANE OF THE

CHICROPLAST (BY SIMILARITY).

-I-SUBCELLULAR LOCATION: SIMILARITY).

-I-SUBCELLULAR LOCATION: GOTHER PLANTS CTPT. ALSO SIMILAR TO

YEAST PROTEIN SLY41.
                                                                                                                                                                                                                                                 Eukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta,

PRT;

STANDARD;

KDC2_DROME

Genes Dev. 2:1539-1556(1988).
-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-!- TISSUE SPECIFICITY: MORE ABUNDANT IN ADULT HEAD THAN ADULT BODY.
-!- DEVELOPMENTAL STAGE: IN EMBRYONS, PUPAE AND ADULTS.
-!- DEVELOPMENTAL STAGE: IN EMBRYONS, PUPAE AND ADULTS.
-!- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
CAMP SUBFAMILY.

-!- CATALYTIC ACTIVITY: Hydrolyzes proteins with a preference for Tyr or Phe in the Pl' position. Has no action on amino-acid pnitroanilides.
-!- COPACTOR: BINDS 1 ZINC ION (FOTENTIAL).
-!- COPACTOR: BINDS 1 ZINC SECRETED.
-!- SUBCELLULAR LOCATION: SECRETED.
-!- PTM: THE N-TERMINUS: EBLOCKED.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY M7.

The present sequence is from an antithrombin III (ATIII) variant, Bb.C derived from human ATIII.N135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-395. The variant has compressed and insert of the pBlueBac baculovirus expression construct and comprises residues 385-395. The variant has retains anti-thrombin and anti-factor Xa activities. It may be expressed as glycoforms with enhanced heparin affinity which target the collocd vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activationated databologies, trauma, acute respiratory distress syndrome, testenosis, thrombosis, thrombosis, thrombosism and stroke. It can also be used to reduce the risk of reocclusion and restenosis in percutanceus transluminal coronary angioplasty, thrombosis associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
                                                                                   'note= "ATIII.N135A Thr at 386 is substituted by Glu"

```
The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
Human; foetal liver; gene expression; single exon nucleic acid probe.

                                                                                                                                                                                                                                                                                                                          Penn SG,
```

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see Mar21555-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenical heart disease.

hypertension, but was obtained in electronic form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Single exon nucleic acid probes for analyzing gene expression in human hearts -

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta -

Claim 27; SEQ ID No 33044; 654pp; English.

The present invention relates to single exon nucleic acid probes (SENP: see AA131315_AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying sene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders

Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples -

Claim 27; SEQ ID No 32016; 634pp; English

The whomical relates to a spatially agartesisable set on single exon mucleic acid probes having one of from human lung comprising single exon mucleic acid probes having one of from human lung comprising single exon mucleic acid probes having one of 12614 mucleic acid sequences mentioned in the apecification, or their probes. Also included are a microarray ocomprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung; measuring gene expression in a collection of detectably labeled nucleic acids derived from human lung a collection of detectably labeled nucleic acids derived from human lung; measuring the labeled nucleic acids derived from human lung a collection of detectably bound to each probe of the array; identifying exons in a enkaryotic genome, comprising (a) identifying exons in a enkaryotic genome, comprising (b) detecting specific hybridisation of detectably labeled nucleic acids from enkaryote lung mRNA, to a single exon probe. In the above mentioned microarray; assigning exons to a single exon probe in the above mentioned microarray; assigning exons to a single exon probe in the above mentioned microarray; assigning exons in several tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon where a common pattern of expression of the exons in the tissues and/or cell types using hybridisation to a single comprising of the exons should be assigned to a single gene, a peptide comprising of expression analysis, and for identifying exons in a gene, particularly expression analysis, and for identifying exons in a gene, particularly fibrosis, neurofibromated in the specification, or encoded by the exons should be assigned to a single gene, a special or expression analysis, pulmonary hydrices, faragener syndhomary probasis, pulmonary hydrices, faragener syndhomary probasis, pulmonary hydrines, faragener syndhomary pulmonary proteinosis, membrane din The invention relates to a spatially-addressable set of single exon

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, Ruben SM WPI; 2001-488783/53. N-PSDB; AAS25971. New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives -

Claim 11, SEQ ID No 937; 980pp; English

The invention relates to isolated nucleic acid molecules and their cocoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliocate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, doags, chickens or sheep. They are also used in diagnosting a pathological condition. Antibodies to the proteins can also to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. candiac arrest, cerebroakscular disorders e.g. candiac autoins caused by bacteria, viruses and fungiand coular disorders e.g. candiaction, and many other content, to maintain organs before transplantation, for supporting call culture of primary tissues, to resentate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present components a novel secreted protein of the invention.

Sequence 43, Application US/08902623
Patent No. 5922545
GENERAL INFORMATION:
APPLICANT: MATTHERAKIS, LARRY C.
APPLICANT: DOWRR, WILLIAM J.
TITLE OF INVENTION: IN VITRO PEPTIDE AND ANTIBODY DISPLAY
TITLE OF INVENTION: LIBRARIES
NUMBER OF SEQUENCES: 75
CORRESPONDENCE ADDRESS:
ADDRESSEE: TWO FORNSEND AND TOWNSEND AND CREW LLP
STREET: TWO EMBARCADERO CENTER, 8TH FLOOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 34; DB 2; Length 93;

OM protein - protein search, using sw model

December 11, 2003, 18:19:54; Search time 8.33333 Seconds (without alignments) 103.862 Million cell updates/sec Run on:

US-10-014-658-8 46 1 SEEGEGSGR 9

Title: Perfect score: Sequence:

Scoring table: BLOSUM62 Gapop 10.0 , Gapext 0.5

283308 segs, 96168682 residues Searched: Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database :

PIR 76:*
1: pir1:*
2: pir2:*
3: pir3:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

127863 Total number of hits satisfying chosen parameters: 127863 segs, 47026705 residues Searched:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt_41:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Phosphoenolpyruvate-insensitive phosphofructokinase isozyme from
Thermus thermophilus HBB.";
J. Biochem. 109:199-203(1991).
-!-CATALYTIC ACTIVITY: ATP + D-fructose 6-phosphate = ADP + D-
fructose 1,6-bisphosphate.
-!- BNZYME REGULATION: ALLOSTERICALLY INHIBITED BY PHOSPHOENOLPYRUVATE
WHICH INDUCES THE DISSOCIATION OF THE ACTIVE TETRAMER INTO AN
INACTIVE TWO-SUBUNIT PROCABLY.
-!- PATHWAY: Key. control step of glycolysis.
-!- SUBUNIT: Homotetramer.
-!- SUBUNIT: Homotetramer.
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SUBLITY: Belongs to the phosphofructokinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HAMAP: MF_00339; -: 1.

-! SUBCELLULAR LOCATION: Secreted (Potential).
-! SUBCELLULAR LOCATION: Expressed in inner ear structures; the
spindle-shaped cells of the basilar papilla. Weaker expression
found in the inferior and superior fibrocartilaginous plates and
skeletal muscle.

Human peptide #571 encoded by breast cell single exon nucleic acid probe
  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements / fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipidaemia and hypercholescrolemia which is associated with coronary heart disease. ABG47348-ABG59930 represent human liver single exon encoded peptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                   Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia,
hypercholesterolaemia, coronary heart disease.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 47 cells. The method involves contracting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label contracting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label control of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.WiPo.int/Pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the production of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies compectific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and activity of P. acnes polypeptides and activity of P. acnes polypeptides and activity of P. acnes production of antibodies and diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (RLISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO. It ftp.wipo.int/pub/published_pot_sequences.

The present invention relates to ERA binding domain polypeptides (AAG99559-AAG99989 and AAM00010-AAM00021). The era gene in Escherichia coli codes for an essential GTPase protein able to autophosphorylate at serine and/or threonine residues. The protein has potential antimicrobial and antibacterial activity and is useful in screening for antagonists, agonists and for compounds with antibiotic activity. The proteins are also useful in determining their role in pathogenesis of infection, dysfunction and disease and could be used as part of a vaccine and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                           New ERA binding domain polypeptides and polynucleotides encoding them, useful as research reagents and materials for discovery of treatments and diagnostics for diseases, or for genetic immunisation -

The present sequence is from an antithrombin III (ATIII) variant, 5EA derived from human ATIII.M155A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be sypressed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-related pathological symptoms due to sepsis, trauma, acute respiratory distress syndrome, restenosis, thrombosmbolism and stroke. It can also be used to reduce the risk of reocclusion and stroke in percutaneous transluminal coronary ampioplasty, thrombosis associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
                                                                                                                                                                                                                                                                                           New modified human antithrombin III compounds, used for treating e.g. sepsis, trauma, acute respiratory distress syndrome, restenosis, thromboembolism or stroke -
                                                                                                                                                                                                                           Zendehrouh P;

New modified human antithrombin III compounds, used for treating e.g. sepsis, trauma, acute respiratory distress syndrome, restenosis, thromboembolism or stroke -

Claim 13, Page 57; 75pp; English.

The present sequence is from an antithrombin III (ATIII) variant, 13.C derived from human ATIII.N135A CDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while expressed as glycoforms with enhanced heparin affinity which target the chlod vessel wall more-efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to tream thrombin activation-related pathological symptoms due to sepsis, trauma, acute and stroke: It can also be used to reduce the risk of reocclusion and stroke: It can also be used to reduce the risk of reocclusion and restencisis in percutaneous transluminal coronary angioplasty, and coagulation abnormalities in cancer or surgical patients.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

AAY44466 standard; peptide; 9 AA. AAY44466; AAY44466

RESULT 1

(first entry) 27-MAR-2000 Human antithrombin III variant 7EVEA (residues 385-393).

Human, antithrombin III; ATIII variant 7EVEA; elastase-resistant; IgG activated neutrophil resistant; anti-thrombin activity; heparin; anti-factor Xa activity, blood clotting disorder; sepsis; trauma; stroke; thrombin activation-related pathological symptom; restenosis; thrombosis; acute respiratory distress syndrome; thromboembolism; reocclusion.

Homo sapiens.

Synthetic.

A Molecule type: mRNA A Molecule type: 2-97. K', 99-120, 'QA', 123-154,'W', 156-183 < LB2>
A, Cross-references: GB:K01930; NID:9204130; PIDN:AA41154.1; PID:9204131
A, Note: initiator Met not shown
A, Note: initiator Met not shown
C, Comment: This ferritin mRNA was isolated from liver parenchymal cells.
C, Comment: The rat light chain has an octopeptide insertion after residue 158 compared v
C, Comment: Ferritin is an intracellular molecule that stores iron in a soluble, nontoxic
C, Comment: There are two types of ferritin subunits: L (light) chain and H (heavy) chair
C, Comment: In rat liver the light chain is the major chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ribeibold, E.A.; Munro, H.N.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MAI. Acad. Sci. U.S.A. 84:2233-2237(1987).

-I- FUNCTION: TRANSPORT OF PHOSPHORYLATED LYSOSOMAL ENZYMES FROW
THE GOLG! COMPLEX AND THE CELL SURFACE TO LYSOSOMAL.

ENZYMES BEARING PHOSPHOMANNOSYL RESIDUES BIND SPECIFICALLY TO
MANNOSE-6-PHOSPHATE RECEPTOR. IN THE GOLG! APPARATUS AND THE
RESULTING RECEPTOR-LIGAND COMPLEX IS TRANSPORTED TO AN ACIDIC
PRELYOSOMAL COMPARTMENT WHER THE LOW PH MEDIATES THE DISSOCIATION
OF THE COMPLEX. THIS RECEPTOR ALSO BINDS INSULIN GROWTH FACTOR II.

-I- SUBCELLULAR LOCATION: TYPE I membrane protein. Lysosomal.

-I- SUBCELLULAR CONSERVED REGION WITHIN THE REPEAT CONSISTS OF A
STRETCH OF 13 AA THAT CONTAINS CYSTEINES AT BOTH BNDS.

-I- SIMILARITY: CONTAINS I fibronectin type II domain.
                                                                                                                                                                                                                                                                                    01-AUG-1988 (Rel. 08, Created)

                                                                                                                                                                                                                                                                                                                                                                DOWAIN: THE RAT LIGHT CHAIN HAS AN OCTOPEPTIDE INSERTION AFTER RESIDUE 118 COMPARED WITH OTHER LIGHT CHAINS.
MISCELLANEOUS: THERE ARE TWO TYPES OF PERRITIN SUBUNITS: L. (LIGHT) CHAIN AND H. (HEAVY) CHAIN. THE MAJOR CHAIN CAN BE LIGHT OR HEAVY, SUPERDINION ON THE SPECIES AND TISSUE TYPE.
SIMILARITY: BELONGS TO THE FERRITIN FAMILY.
SIMILARITY: Contains 1 ferritin-like diiron domain.

Biochem. Physiol. 118B:667-673(1997).
-!- FUNCTION: Perritin is an intracellular molecule that stores iron in a soluble, nontoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           core is deposited.
-! MISCELLANEOUS: THERE ARE TWO TYPES OF FERRITIN SUBUNITS: L (LIGHT)
CTAIN AND H (HEAVY) CHAIN. THE MACOR CHAIN CAN BE LIGHT OR HEAVY,
DEPENDING ON THE SPECIES AND TISSUE TYPE.
-!- SIMILARITY: BELONGS TO THE FERRITIN FAMILY.
-!- SIMILARITY: Contains 1 ferritin-like dilicon domain.
                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bos taurus (Bovine).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the cares. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the protests of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies pecific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and civity of P. acnes polypeptides and diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form mat of the printed specification, but was obtained in electronic format directly from WIPO at the vipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                     Example 1; SEQ ID No 13803; 1069pp; English.

Vinuela E;

Recombinant swinepox virus vector - used particularly for vaccines against infectious agents, including pseudorabies

Example 2; Column 101-104; 70pp; English

This sequence comprises a polypeptide, designated C20L, encoded by the antisense strand (open reading frame 1) of the HindIII C by the antisense strand (open reading frame 1) of the HindIII C tragment (see APAPA\$564) of swinepox virus (sPV). C20L shows 72\$ identity with vaccinia putative protein kinase (432 amino acid (aa) overlap) and 20\$ identity with yeast clathrin heavy chain content of a overlap). A claimed recombinant vector comprises a heterologous nucleotide sequence inserted into, or replacing, all content of a non-essential SPV gene or nucleic acid sequence or a portion of a non-essential SPV gene or nucleic acid sequence or the HindIII C fragment. The vector can be used for the expression of heterologous proteins, both in vivo as a vaccine, and in vitro for production of the selected protein. The and in vitro for production of the selected protein. The for use in swine vaccines is so a so a selection with the virus to other content is preferably pseudorables virus gps0 or gps3 for use of modified recombinant SPV as a live vaccine vector. (Updated on 25-MAR-2003 to correct PF field.)

This is the amino acid sequence of tomato ringspot virus (TRSV) coat protein (see AAW79282), as deduced from a coding sequence (see TAV65931) in the 3' terminal region of the RNA of a peach isolate of TRSV. The invention provides an isolated coat protein or polypeptide from a peach isolate of TRSV, and a DNA sequence cooling it, as well as a heterologous expression system, host cells, transgenic plants containing coat protein DNA or its antisense form (also their seeds and propagules), antibodies and probes that recognise the coat protein. The transgenic plants or seconds that coat protein. The transgenic plants is remarked to protein protein. Since coat protein is not produced, there is no danger that heteroencapsidation or recombination between transgenic and viral RNAs can occur. TRSV can be diagnosed using the antibodies or probes.
                                                                                                                                     isolated cost protein from tomato ringspot virus and related DNA, vectors, transformed cells - antibodies and transgenic plants with inheritable resistance to the virus
                                                                                                                                                                                                                                 Claim 2; Page 9-11; 65pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of collapses, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of diagnosis, treatment, prevention and/or prognosis of a wide range of immunodeficiency disorders (e.g. Alzhelmer's disease), metabolic disorders (e.g. Alzhelmer's disease), metabolic disorders (e.g. phenylketomuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), block-related disorders (e.g. themophilia), reproductive disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polymclecides of the invention can also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                        Novel polypeptides and polynuclectides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for the confidential partial in gene therapy techniques to restore normal activity of (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical confidential aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in dignostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

Configuration and acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pot_sequences.

WPI; 2001-376931/40. N-PSDB; AAH67228 Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene

Claim 17; SEQ ID NO: 5763; 246pp + Sequence Listing; English.

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, Coryneform bacterium, Coryneform bacterium, Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, Coryneform bacterium are useful for producing amino acids, nucleic acids, thamins, saccharides and organic acids, particularly L.lysine. The present sequence is a protein described note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.

Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune disorders and neuronal disorders

Claim 1; SEQ ID No 1031; 880pp; English

The invention relates to novel isolated polypeptides (I), and polynucleotides (II). (I), (II) and the antibody to (I) are useful for diagnosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune disorders (e.g. rheumatoid arthritis), inflammatory conditions, organ transplant rejections and graft versus host disease, infectious diseases (e.g. hepatitis C), bleeding disorders, haemoglobin abnormalities and

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- SUBCELLULAR LOCATION: Cytoplaemic (Potential).
-!- SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              16-0CT-2001 (Rel. 40, Created)

useful for preventing, diagnosing and/or treating nervous system cancers and metastases -

Claim 11; SEQ ID NO 3418; 1701pp + Sequence Listing; English.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other anners of the adrenal gland, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and parasitic infections diseases such as viral, bacterial, fungal and parasitic infections diseases such as viral, bacterial, fungal

The present sequence is from an antithrombin III (ATIII) variant, Bb.D derived from human ATIII.M135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be expressed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-related pathological symptoms due to sepsis, trauma, acute respiratory distress syndrome, restenosis, thromboembolism and stroke. It can also be used to reduce the risk of reocclusion and restenosis in percutaneous transluminal coronary angioplasty, thrombosis associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
                                                                                                                                                                                                                                                                                                                                                                                                          New modified human antithrombin III compounds, used for treating e.g. sepsis, trauma, acute respiratory distress syndrome, restenosis, thromboembolism or stroke -
                                                                                                                                                                                                                                                                                                                                      Bock SC, Picard V, Zendehrouh P;
